SPDT switch for GPIO input testing

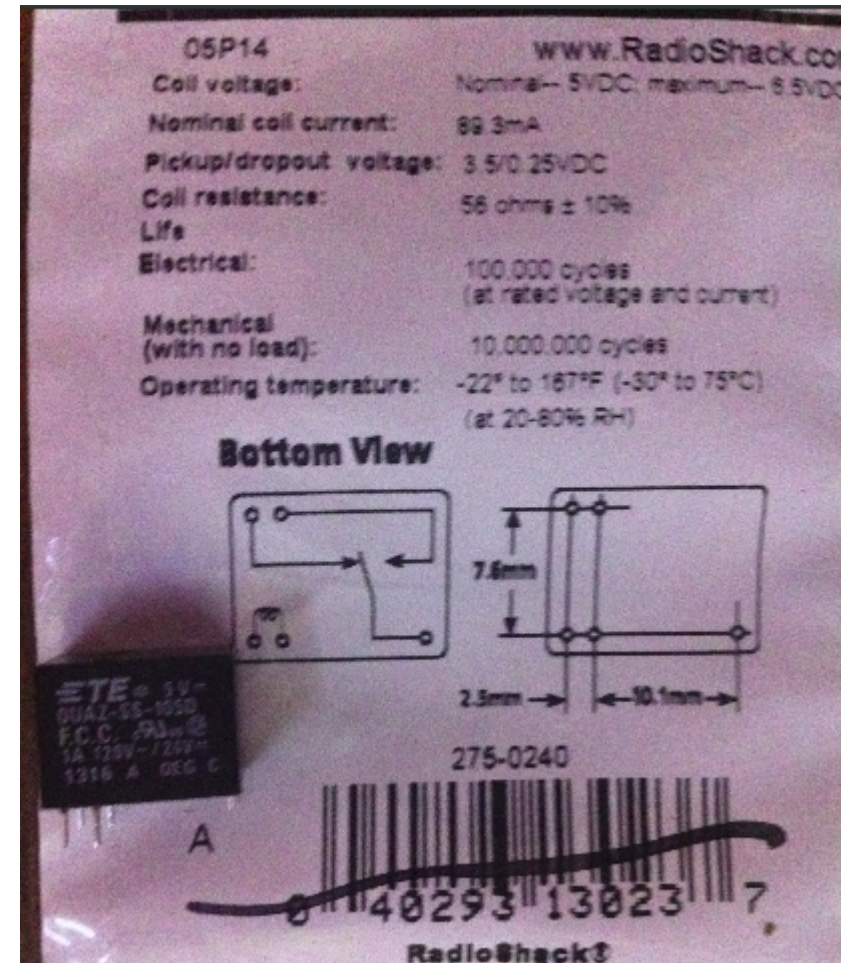

Board: 16 x 11 mm or 6.25 x 4.50 inch

A Single Pole Double Throw (SPDT) switch is a switch that only has a single input and can connect to and switch between 2 outputs.

GPIO (GPP) Controller and SPRs

1. Definition of SPRs:
Special purpose registers are those to perform init and config functions.
2. 32 bit each with unique address.
3. In IDE (software, e.g., eXpresso in this class), *.h file with something looks like the following
#define SPR 0x2000_0000
map the CPU architecture to the arm gcc compiler to the arm gcc compiler

Background:

From CPU datasheet, GPIOs are configured using the following registers:

1. Power: always enabled.
2. Pins: See Section 8.3 for GPIO pins and their modes.
3. Wake-up: GPIO ports 0 and 2 can be used for wake-up if needed, see (Section 4.8.8).
4. Interrupts: Enable GPIO interrupts in IO0/2IntEnR (Table 115) or IO0/2IntEnF (Table 117). Interrupts are enabled in the NVIC using the appropriate Interrupt Set Enable register.

9.4 Pin description

P0[30:0] [1] ; Type: Input/Output; Description: General purpose in/output.

From SCH pdf doc make connection from this GPP pin to physical connector pin out, e.g., J2-21, J2-22 etc.

Table 102. GPIO register map, from CPU data sheet pp133

FIODIR Fast GPIO Port Direction control register, controls the direction of each port pin

FIOSET Fast Port Output Set register using FIOMASK.

This register

R/W

controls the state of output pins. Writing 1s produces highs at the corresponding port pins. Writing 0s has no effect. Reading this register returns the current contents of the port output register. Only bits enabled by 0 in FIOMASK can be altered.

FIOCLR Fast Port Output Clear register using FIOMASK. This register WO controls the state of output pins. Writing 1s produces lows at the corresponding port pins. Writing 0s has no effect. Only bits enabled by 0 in FIOMASK can be altered.

Bit	Symbol	Value	Description
31:0	FIO0DIR		Fast GPIO Direction PORTx control bits. Bit 0 in FIOxDIR controls pin Px.0, bit 31 in FIOxDIR controls pin Px.31.
	FIO1DIR		
	FIO2DIR	0	Controlled pin is input.
	FIO3DIR	1	Controlled pin is output.
	FIO4DIR
